"The P-selectin gene is highly polymorphic: reduced frequency of the pro715 allele carriers in patients with myocardial infarction.";

Hum. Mol. Genet. 7:1277-1284(198).

-i- FUNCTION: CA(2+)-DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS FOR CARBONYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE INVERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH LEUKOCYTES. THE LIGAND RECOGNIZED IS STAYLYL-LEWIS X.

-i- SUBSCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-i- TISSUE SPECIFICITY: STORED IN THE ALPHA-GRANULES OF PLATELETS AND WEIBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL AND WEIBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL AND TO THE PALADE BODIES OF ENDOTHELIAL CELLS.

J. MOI. Biol. 272:253-265(1997).

-I- FUNCTION: SERVES TO PROTECT THE VIRUS AGAINST COMPLEMENT ATTACK BY INHIBITING BOTH CLASSICAL AND ALTERNATIVE PATHWAYS OF COMPLEMENT ACTIVATION. BINDS C3B AND C4B.

-I- SIMILARITY: BELONGS TO THE SUPERFAMILY OF THE REGULATORS OF COMPLEMENT ACTIVATION (BCA).

-I- SIMILARITY: CONTAINS 4 SUSHI (SCR) REPEATS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: CA(2+)-DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS
TO CARBOHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE
INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH
LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALYL-LEWIS X.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: STORED I MEMBRANE PROTEIN.
SISSUE SPECIFICITY: STORED INTER ALPHA-GRANULES OF PLATELETS
AND WEIBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL
ACTIVATION BY AGONISTS, P-SELECTIN IS TRANSPORTED RAPIDLY TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: TO OTHER SELECTINS/LECAMS.
SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.
SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.
SIMILARITY: CONTAINS 8 SUSHI (SCR) REPEATS; MOUSE P-LECTIN LACKS
THE HUMAN SUSHI-2 EQUIVALENT.

PROTEINS. IT IS ALSO FOUND ON THE SURFACES OF EPITHELIAL CELLS
LINING EXTRACELLULAR COMPARTMENTS, AND VARIANTS OF THE MOLECULE
ARE PRESENT IN BODY FLUIDS AND IN EXTRACELLULAR MATRIX.

-!- DOMAIN: THE FIRST SUSHI DOMAIN (SCR1) IS NOT NECESSARY FOR
FUNCTION. SCR2 AND SCR4 PROVIDE THE PROPER CONFORMATION FOR THE
ACTIVE SITE ON SCR3 (BY SIMILIARITY).

-!- PTM: THE SER/THR-RICH DOMAIN IS HEAVILY O-GLYCOSYLATED.
-!- POLYMORPHISM: DAF IS RESPONSIBLE FOR THE CROMER BLOOD GROUP
SYSTEM. IT CONSISTS OF AT LEAST SEVEN HIGH-INCIDENCE (CR(A),
TC(A), DR(A), ES(A), WES(B), UMC, AND IFC) AND LOW-INCIDENCE
(TC(B), TC(C), AND WES(A)) ANTIENS THAT RESIDE ON DAF. IN THE
CROMER PHENOTYPES DR(A-) AND INAB THERE IS REDUCED OR ABSENT
PHENOTYPE, A SINGLE NUCLEOTIDE SUBSTITUTION WITHIN EXON 5 ACCOUNTS
FOR TWO CHARGES: A SIMPLE AMINO ACID SUBSTITUTION THAT IS THE
BASIS OF THE ANTIGENIC VARIATION, AND AN ALTERNATIVE SPLICING
EVENT THAT UNDERLIES THE DECREASED EXPRESSION OF DAF IN THIS
DHENOTYPE

-i- FUNCTION: THIS PROTEIN RECOGNIZES C4B AND C3B FRAGMENTS THAT CONDENSE WITH CELL-SURFACE HYDROXYL OR AMINO GROUPS WHEN NASCENT C4B AND C3B ARE LOCALLY GENERATED DURING C4 AND C3 ACTIVATION. INTERPRACTION OF DAF WITH CELL-ASSOCIATED C4B AND C3B POLYPEPTIDES INTERPERES WITH THEIR ABILITY TO CATALYZE THE CONVERSION OF C2 AND FACTOR B TO ENZYMATICALLY ACTIVE C2A AND BB AND THEREBY PREVENTS THE FORMATION OF C4B2A AND C3BBB, THE AMPLIFICATION CONVERTASES OF THE CONFLEMENT CASCADE.

-i- FUNCTION: ALSO ACTS AS THE RECEPTOR FOR ECHOVIRUS 7 AND RELATED VIRUSES (ECHOVIRUSES 13, 21, 29 AND 33).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or send an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VIRUSES (ECHOVINUSES 13, 21, 29 AND 33).

-i- SUBUNIT: MONOMER (MAJOR FORM) AND NON-DISULFIDE-LINKED, COVALENT HOMODIMER (MINOR FORM).

-i- SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.

-i- ALTERNATIVE PRODUCTS: TWO FORMS OF DAF (DAF-2, SHOWN HERE, AND DAF-1) ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE.

-i- TISSUE SPECIFICITY: EXPRESSED ON THE PLASMA MEMBRANES OF ALL CELL
                                                                                                                                                                                                ; A39101; A39101;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ELECTRON MICROSCOPY, 3-DIMENSIONAL STRUCTURE, MEDLINE; 83221615.
                                                                                                                                                                                                                                                                                               (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BCA COMPLEX (C3 CONVERTANCE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH ANTICOAGULANT PROTEIN S AND WITH SEROM AMYLOID P COMPONENT.
SUBUNIT: DISSULFIDE-LINKED COMPLEX OF C4BP ALPHA AND BETA CHAINS OF 3 POSSIBLE SORTS: A 570 KD COMPLEX OF 7 ALPHA CHAINS AND 1 BET CHAIN, A 530 KD HOMOHEPTAMER OF ALPHA CHAINS OR A 500 KD COMPLEX OF 6 ALPHA CHAINS AND 1 BETA CHAIN. THE CENTRAL BODY OF THE ALPHA CHAIN HOMOPOLYMER SUPPORTS TENTACLES, EACH WITH THE BINDING SITE FOR C4B AT THE END.
                                                                                                                                                                                                                    SIMILARITY: CONTAINS 8 SUSHI (SCR) REPEATS.
SIMILARITY: TO C4BP BETA CHAIN AND TO PIG APOLIPOPROTEIN R.
CAUTION: IT IS UNCERTAIN WHETHER MET-1 OR MET-17 IS THE INITIATOR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   H related antigen, or nucleic acid encoding it

Example 6B; Fig 6B; 104pp; English.

This partial protein is found in clone pRRB9FH410 and represents a complement factor H related protein with homology to a region of the human tumour-associated complement factor H (CFH). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer agents that may modulate this antigen could be used in the manufacture of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10-JUN-1999 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating or screening for cancer, e.g. renal or urogenital cancer by modulating or detecting tumour associated human complement Factor

                                                                                                                        P-selectin gene - for regulating gene expression in engotherial cells and mega:karyocyte(s) bisclosure; Fig 1; 88pp; English.

The sequence is that of the P-selectin gene product from endothelial cells, determined from a composite of four overlapping cDNAs: lambda GMPE1-lambda GMPE4. The P-selectin gene or its fragments may be used GMPE1-lambda GMPE4. The P-selectin gene or its fragments may be used
                                                          to inhibit P-selectin expression, thus controlling inflammatory and haemostatic processes in e.g. rheumatoid arthritis, ischaemic injury bacterial sepsis, tumour metastases, atherosclerosis, etc. Sequence 830 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               endothelium, contributes to the binding and subsequent transmigration of inflammatory cells into the graft tissue that occurs during acute cellular allograft rejection. Therefore, preventing expression of E-sel on the donor tissue may reduce the risk of rejection by modulating E-sel mediated cell adhesion. Fragments of the nucleotide sequence encoding E-sel may be used as polymerase chain reaction (PCR) primers or hybridization probes for the identification and/or isolation of the porcine E-sel gene from genomic DNA. Antisense sequences may be used to inhibit the expression of E-sel. DNA constructs may be used to introduce antisense sequences to a cell, or to inactivate the E-sel gene (e.g. knock-out constructs). Cells in which the expression of E-sel has been prevented may be used as disease models or to produce transplantation with

Combine protein possesses a hydrophobic N-terminal sequence contaracteristic of a signal sequence. It is predicted that the mature contaracteristic of a signal sequence. It is predicted that the mature contaracteristic of a signal sequence. It is predicted that the including contare in the polypeptide is ca. 554 amino acids including contains of the polypeptide is ca. 554 amino acids including contended by a hydrophobic transmembrane contains of 24 amino acids. It is noted that the protein contains claven N-glycosylation sites.

Contains be used to identify molecules which inhibit binding of claucocytes to cells, and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited contains eleven n-glycosylation sites.

Contains and such binding can be inhibited can be inhibited such contains eleven n-glycosylations and such binding can be inhibited can be under the protein contains eleven n-glycosylations and such binding can be inhibited can be inhibited such contains eleven n-glycosylations and such binding can be inhibited can be under the protein contains eleven n-glycosylations and such binding can be inhibited can be under the protein possesses a short, charged near the protein contains eleven n-glycosylations and such binding can be inhibited near the protein can be treated under the protein can be under the protein

                                                            adhesion protein.

Disclosure; 44pp; English.

ELAM specific antibodies, attached to a suitable drug eg. a cytotoxin can direct the action of the drug to sites of inflammation, tissue damage and infection. The same Abs can be used to treat leukaemia, lymphoma, vasculitis and metastic spread of cancer cells. Labelled ELAM specific Abs can be used to detect expression of the adhesion molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is E-selectin (formerly known as endothelial leukocyte adhesion molecule-1; ELAM-1). E-selectin is identified by specific binding of murine monoclonal antibodies H4/18 and H8/7, developed against stimulated endothelial cells. New immunoconjugates of the invention comprise monoclonal antibody H18/7, or a fragment which binds to E-selectin conjugated to a therapeutic agent. The immunoconjugate is used to selectively target the therapeutic agent to activated endothelium expressing E-selectin, especially for treating inflammation, microbial infections, post-reperfusion injury, malignant tumours, vasculities vascular emotathemuscoperfusion injury, malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or acute or chronic allograft rejection.                                                      Chimeric proteins for inhibiting complement-mediated cell lysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents human endothelial leukocyte adhesion molecule-1 (ELAM-1). ELAM-1 is a membrane glycoprotein which is induced by a number of cytokines. Pathological conditions associated with the overexpression of cellular adhesion molecules, such as ELAM-1 or intracellular adhesion molecule-1 (ICAM-1), can be treated with the novel pharmaceutical composition of the invention. The composition comprises an effective amount of an ICAM-1 antisense molecule encapsulated in a lipid mixture, the lipid mixture comprising at cationic lipids. The composition is used in a method to treat pathological conditions associated with overexpression of ICAM-1, such as Alzheimer's disease, multiple sclerosis, viral hepatitis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A portion (W06881) of the complement-inhibitor, decay accelerating factor (DAF), is used in novel chimeric proteins of formula A-R1-B-R2-C, where A and C are peptides (W06875-79, W06883-90) able to bind glycosaminoglycans (esp. heparin) present on cell surfaces, R1 is a portion of DAF or membrane co-factor protein (MCC, see also W06880), R2 is DAF when R1 is MCP or MCP when R1 is DAF, and B is a peptide that may have complement inhibitor activity. The chimeric proteins (see also W06882) are directed to cell surfaces where they inhibit complement-mediated cell lysis. They are used to treat and prevent disease states in which complement plays a role, e.g. sepsis, adult respiratory distress syndrome, reperfusion injury and the second complement in the second complement in the second complement plays a role, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human decay accelerating factor:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tissue damage
                                   This protein sequence comprises human decay accelerating factor (DAF), a protein that has C3 complement inhibitor activity. Claimed retroviral vector particles express a complement inhibitor such as DAF, and are thereby protected from inactivation upon exposure to body fluids containing complement. Also claimed are: (1) a producer cell producing the vector particle; and (2) a chimeric retroviral envelope protein (see also W26326) with at least part of the N-terminal receptor-binding domain removed and replaced by a protein domain having a complement inhibitor activity. The vector is used in a claimed method for transducing cells in the presence of a body fluid containing complement, preferably ex vivo, especially for gene therapy, e.g. of hereditary or acquired blood disorders by
                                                                                                                                                                                                                                                                                                Retroviral vector particle expressing complement inhibitor activity for transducing cells in body fluids containing complement Disclosure; Column 41-46; 32pp; English.

A probe (given in Q79865) based on the N-terminal sequence of human decay accelerating factor (DAF) was used to screen a HeLa cell lambda cDNA library. Isolated clones encoding membrane-bound DAF (mDAF) were obtained, and the full sequence of mDAF cDNA was determined (Q79863). The GPI signal domain of mDAF may be fised to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB; Q79863.
Liposome(s) for targetting particular cells contg. fusion protein of glyco:phosphatidyl:inositol anchor and heterologous targetting protein, e.g. for delivering toxins to infected or

The probable phosphatidylinositol derivatisation site is Cys(330).
The DAF variant is useful for treating paraoxysmal nocturnal haemoglobinuria, or inflammatory or cell lytic autoimmune diseases. It may be used to ameliorate allograft rejection or autoimmune diseases. See also N70046, N70048.

                                                                                                                                                                                                                                                                                                           Example 3; Page 8-9; 15pp; Japanese.

This sequence is the human decay accelerating factor (DAF) protein.

DAF can be used in the viral vector of the invention. The viral vector contains a factor controlling the function of a human complement protein, particularly a membrane combining type protein. The viral vector, which is stable in situ, is useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Vector having complement controlling factor - useful for gene

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Thu Jun 8 21:40:50 2000; MasPar time 9.79 Seconds 641.132 Million cell updates/sec

Tabular output not generated.

Title: >US-09-316-163-10
Description: (1-265) from US09316163.pep
Perfect Score: 2029\_\_\_\_\_\_\_

Sequence: 1 EDCNELPPRRNTEILTGSWS.....EKSCDNPYIPNGDYSPLRIK 265

Scoring table: PAM 150 Gap 11

Searched: 188963 segs, 23686106 residues
Post-processing: Minimum Match 08
Listing first 45, Summaries

a Tgeneseq36

Database:

Statistics: Mean 32.240; Variance 119.188; scale 0.271

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating or screening for cancer, e.g. renal or urogenital cancer-
by modulating or detecting tumour associated human complement Factor
H related antigen, or nucleic acid encoding it
Example 6B; Fig 6B; 104pp; English.
This partial protein is found in clone pRRB9FH410 and represents a
complement factor H related protein with homology to a region of the
human tumour-associated complement factor H (CFH). The detection of this
protein and a CFH antigen can be used in screening or for the treatment
of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer,
Agents that may modulate this antigen could be used in the manufacture of
a medicament for the treatment of a tumour cell.
                                                                                                                                                                                                                                               peptide
                                                                                                                                                                                                                                                                                                   Homo sapiens

PT New C4 binding protein fusion proteins and DNA encoding them comprise assemblies of C4bp monomers linked to functional moiety, PT e.g. AZT, useful as delivery vehicles in diagnosis and therapy CC presence was deduced from human hepatocyte (Hep G2) cDNA CC obtained following PCR amplification. The protein is a monomer containing 8 SCRs. Each SCR forms a looped domain due to the presence of two intradomain disulphide bonds (only the disulphide cc bresence of two intradomain disulphide bonds (only the disulphide cc bresence of two intradomain disulphide bonds (only the disulphide cc bresence of two intradomain disulphide bonds (only the disulphide cc bresence of two intradomain disulphide bonds (only the disulphide cc bresence of two intradomain disulphide bonds (only the disulphide cc the first cysteine residue bonds with the fourth. This secondary structure is cresponsible for the conformational flexibility of the C4bp monomer. CC cysteine residue bonds with the fourth. This secondary structure is cresponsible for the conformational flexibility of the C4bp monomer. CC is fused to the C-terminal of a protein such as a viral receptor, cc cell ligand, a bacterial, viral or parasitic immunogen, enzyme, cc cytokine, toxin, etc. See also Q13243-51.

- encoded by Vaccinia virus 35K gene
Disclosure; Figure 2A, 20pp; English.
C4b-binding protein which specifically blocks human complement cascades.
It is the deduced sequence of a 35kDa protein encoded by sequence 52-840 of the 35K gene of vaccinia virus strain WR. Note a - these sites indicate the start of 60 amino acid tandem repeating units which have a consensus sequence. The signal peptide sequence is not found in purified 35K protein recovered from the medium of cells infected with vaccinia virus strain WR. A suggested use is to treat diseases due to abnormally had complement activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-FEB-1990 (first entry)
Deduced sequence of complement 4b (C4b) binding protein
Vaccinia virus WR strain; anti-complement protein; complement
inactivators; complement 4b; C4b.

              retroviral vector particle expressing complement inhibitor activity properties and complement inhibitor activity properties and complement inhibitor activity properties and complement inhibitor sequence comprises the herpesvirus Saimiri secreted complement sequence comprises the herpesvirus Saimiri secreted complement complement complement complement complement and complement and complement and complement are the protected from inactivation upon exposure to body fluids containing complement. Also claimed are: (1) a producer cell producing the vector particle; and (2) a chimeric complement are recomplement and complement complement and complement are retroviral envelope protein (see also W26324) with at least part complement inhibitor activity. The containing a complement inhibitor activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Expression control elements in the 5'- flanking region of the p-selectin gene - for regulating gene expression in endothelial cells and mega:karyocyte(s)
Disclosure; Fig 1; 88pp; English.
The sequence is that of the P-selectin gene product from endothelial cells, determined from a composite of four overlapping cDNAs: lambda GMPE1-lambda GMPE4. The P-selectin gene or its fragments may be used GMPE1-lambda GMPE4. The P-selectin gene or its fragments may be used
                                                                                                                                                                                                                                                                                                                                                 01-JUL-1997.
